In the Claims:

2

1 - 30. (Canceled).

- 31. (Original) A method of illuminating a target comprising:
- a) transmitting light from a light source to a proximal end of a light guide bundle via a spatial light modulator wherein the spatial light modulator transmits the light substantially only to cores of light guides in the light guide bundle;
- b) transmitting the light from the proximal end of the light guide bundle to a distal end of the light guide bundle and emitting the light from the distal end of the light guide bundle; and,
- c) illuminating the target with the light emitted from the distal end of the light guide bundle.
- 32. (Original) The method of claim 31 wherein the method comprises scanning a light beam across the spatial light modulator and simultaneously setting at least one pixel of the spatial light modulator that corresponds to a core of one of the light guides to an on-state to provide at least one on-pixel and setting other pixels of the spatial light modulator to an off-state, whereby the light beam is transmitted substantially only to the core of the light guide when the light beam contacts the on-pixel and the light beam is not transmitted to inter-core areas of the light guide bundle or to light guides adjacent to the light guide.
- 33. (Original) The method of claim 32 wherein the light beam is a laser beam.
- 34. (Original) The method of claim 32 wherein the method comprises scanning the light beam across substantially all pixels that are set to an on-state over time such that substantially all of the light guides in the light guide bundle are illuminated, thereby illuminating substantially all of the target within a field of view of the light guide bundle without moving the light guide bundle.
- 35. (Original) The method of claim 31 wherein the method comprises optically connecting the light source to the spatial light modulator such that the light

source illuminates a substantial portion of the pixels of the spatial light modulator, and setting selected corresponding pixels to an on-state and setting other pixels of the spatial light modulator to an off-state such that light from the light source is transmitted substantially only to the cores of the light guides corresponding to the corresponding pixels.

- 36. (Original) The method of claim 35 wherein the method comprises varying the selected corresponding pixels that are set to an on-state over time such that substantially all of the light guides in the light guide bundle are illuminated, thereby illuminating substantially all of the target within a field of view of the light guide bundle without moving the light guide bundle.
- 37. (Previously Amended) The method of claim 35 wherein the method comprises selecting the selected corresponding pixels that are set to an on-state such that light emanating from the distal end of a first light guide corresponding to a first selected corresponding pixel does not substantially interfere with light emanating from the distal end of a second light guide corresponding to a second selected corresponding pixel.

38-47. (Canceled)

ij

48. (Previously presented) The method of claim 36 wherein the method comprises selecting the selected corresponding pixels that are set to an on-state such that light emanating from the distal end of a first light guide corresponding to a first selected corresponding pixel does not substantially interfere with light emanating from the distal end of a second light guide corresponding to a second selected corresponding pixel.
